P7 – DMA from C

P7 – DMA from C

Programming Sequence

Direct Register Mode (Simple DMA)

P7 – DMA from C

1. Start the MM2S channel running by setting the run/stop bit to 1 (MM2S_DMACR.RS = 1). The halted bit (DMASR.Halted) should deassert indicating the MM2S channel is running.

2. Skip

3. Write a valid source address to the MM2S_SA register.
4. Write the number of bytes to transfer in the MM2S_LENGTH register.
The MM2S_LENGTH register must be written last.
5. Wait until MM2S_DMASR.Idle==1 for completion

P8+ are part of the “Design Challenge”

- Goal: Accelerate reference neural network
- Harder, more open-ended projects

P8+ focus on Dot Product

```
# forward-pass of a 3-layer neural network:  
f = lambda x: 1.0/(1.0 + np.exp(-x)) # activation function (use sigmoid)  
x = np.random.randn(3, 1) # random input vector of three numbers (3x1)  
h1 = f(np.dot(W1, x) + b1) # calculate first hidden layer activations (4x1)  
h2 = f(np.dot(W2, h1) + b2) # calculate second hidden layer activations (4x1)  
out = np.dot(W3, h2) + b3 # output neuron (1x1)
```

Matrix Multiplication (Dot Product)

$$\begin{array}{c} \text{inputs} \\ \underline{[0.1 \quad 0.2]} \end{array} \times \begin{array}{c} \text{weights} \\ \begin{bmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \end{bmatrix} \end{array} =$$

$$= \begin{bmatrix} (0.1 \times 1 + 0.2 \times 4) & (0.1 \times 2 + 0.2 \times 5) & (0.1 \times 3 + 0.2 \times 6) \end{bmatrix}$$

$$= \begin{array}{c} \text{(Answer)} \\ \underline{[0.9 \quad 1.2 \quad 1.5]} \end{array}$$

Floating-Point math takes 8 cycles.

- Floating-Point is complicated.
- FMAC: $a * b + c$
- 8 cycles of complicated.
- How do we work around an 8 cycle latency?
- Pipelining!

FMAC Pipelining

$$\begin{bmatrix} 0.1 & 0.2 \end{bmatrix} \begin{bmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \end{bmatrix}$$

FMAC Pipelining

Latency vs. Throughput

- **Latency:** How long does an individual operation take to complete?

individual mult: 8 cycles

- **Throughput:** How many operations can you complete per second (or per cycle)?

Average output per cycles:

$\sim 1 \text{ mult / cycle}$

Multiply-Accumulate Dot Computations

$$\begin{bmatrix} 0.1 & 0.2 \end{bmatrix} \times \begin{bmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \end{bmatrix} = \begin{bmatrix} 0.9 & 1.2 & 1.5 \end{bmatrix}$$

$= \{ \underline{0} \quad \underline{0} \quad \underline{0} \}$

$$\begin{array}{lll} 0.1 \cdot 1 + 0 & 0.1 \cdot 2 + 0 & 0.1 \cdot 3 + 0 = \begin{bmatrix} 0.1 & \underline{0.2} & \underline{0.3} \end{bmatrix} \\ 0.2 \cdot 4 + 0.1 & 0.2 \cdot 5 + 0.2 & 0.2 \cdot 6 + 0.3 = \begin{bmatrix} 0.9 & 1.2 & 1.5 \end{bmatrix} \end{array}$$

Dependencies

$$\begin{bmatrix} 0.1 & 0.2 \end{bmatrix} \times \begin{bmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \end{bmatrix}$$

Cycles

Category	Cycles
01	10
02	12
03	14
04	16
05	18
06	20
07	18
08	16
09	14
10	20
11	18
12	16
13	14
14	12

18	4
19	2
20	1

Dependencies on Pipelined FMAC

- Solution: Stall at the end of a row.
- “Drain” the pipeline.
- Restart new row
- “Refill” the pipeline

inputs * weights = dot

5.05

How many cycles should this take?

$$\begin{bmatrix} 0.1 & 0.2 & 0.3 \end{bmatrix} \begin{bmatrix} \underline{1} & \underline{2} & \underline{3} & \underline{4} \\ \underline{5} & \underline{6} & \underline{7} & \underline{8} \\ \underline{9} & \underline{10} & \underline{11} & \underline{12} \end{bmatrix} = \begin{bmatrix} 3.8 & 4.4 & 5 & 5.6 \end{bmatrix}$$

8 cycles 1 multiply x 12 multipliers
= 96 cycles

Data flow graph

- A data-flow graph is a **collection of arcs and nodes in which the nodes are either places where variables are assigned or used**, and the arcs show the relationship between the places where a variable is assigned and where the assigned value is subsequently used.

[\[ref\]](#)

Data Flow Graph

- Illustrates the dependencies between inputs and operations to produce an output

Inputs

Operations

Dependencies

Data Flow Graph

* NO MAC for Now
* NO pipeline

$$\begin{bmatrix} 0.1 & 0.2 & 0.3 \end{bmatrix} \begin{bmatrix} 1 \\ 5 \\ 9 \end{bmatrix} = \begin{bmatrix} 3.8 \end{bmatrix}$$

Finding Parallelism

- Find some computation that doesn't depend on other computation's results.
- No arrows between blocks.
- Shared Inputs are OK.

$$\begin{bmatrix} 0.1 & 0.2 & 0.3 \end{bmatrix} \begin{bmatrix} 1 \\ 5 \\ 9 \end{bmatrix} = \begin{bmatrix} 3.8 \end{bmatrix}$$

Infinite Hardware

← 8 cycles

← 8 cycles

← 8 cycles

 24 cycles

How many cycles should this take?

How many cycles should this take?

$$\begin{bmatrix} 0.1 & 0.2 & 0.3 \end{bmatrix} \begin{bmatrix} 1 \\ 5 \\ 9 \end{bmatrix} = \begin{bmatrix} 3.8 \end{bmatrix}$$

More Data Flow

$$\begin{bmatrix} 0.1 & 0.2 & 0.3 \end{bmatrix} \begin{bmatrix} 1 & 2 & 3 & 4 \\ 5 & 6 & 7 & 8 \\ 9 & 10 & 11 & 12 \end{bmatrix} = \begin{bmatrix} 3.8 & 4.4 & 5 & 5.6 \end{bmatrix}$$

Pipelining

- FMAC takes 8 cycles for 1 value
- But can accept a new value every cycle.

- Latency: 8 cycles / value ↩
- Throughput: 1 value / cycle

Pipelining

$$\begin{bmatrix} \underline{0.1} & 0.2 & 0.3 \end{bmatrix} \begin{bmatrix} 1 & 2 & 3 & 4 \\ \underline{5} & 6 & 7 & 8 \\ 9 & 10 & 11 & 12 \end{bmatrix} = \begin{bmatrix} 3.8 & 4.4 & 5 & 5.6 \end{bmatrix}$$

$$\begin{bmatrix} 0.1 & 0.2 & 0.3 \end{bmatrix} \begin{bmatrix} 1 & 2 & 3 & 4 \\ 5 & 6 & 7 & 8 \\ 9 & 10 & 11 & 12 \end{bmatrix} = \begin{bmatrix} 3.8 & 4.4 & 5 & 5.6 \end{bmatrix}$$
